Abstract (en)

[origin: WO2020239367A1] The invention relates to a brake shut-off arrangement (4; 104) with multiple deactivation devices (401-404; 401-408) which can be transferred from an activation position into a first deactivation position. According to the invention, the brake shut-off arrangement (4; 104) is suitably designed to, as a result of a transfer of one (402) of the deactivation devices (401-404; 401-408) into the first deactivation position thereof, prevent the transfer of at least a proportion (403-404; 403-408) of the remaining deactivation devices (401, 403-404; 401, 403-408) into the first deactivation position thereof, and, if another deactivation device (403) out of the at least one proportion (403-404; 403-408) of the remaining deactivation devices (401, 403-404; 401, 403-408) is already situated in the first deactivation position thereof, effect a transfer of the other deactivation device (403) into the activation position thereof. It is thus possible, with regard to an improvement in driving operation, to ensure an improved reaction to faults of local brake devices (301-304; 301-308). The invention also relates to a brake system (2; 102) with at least one such brake shut-off arrangement (4; 104), to a vehicle (1; 101) with a brake system (2; 102) of said type, and to a method for operating a brake shut-off arrangement (4; 104).
