Abstract (en)

[origin: WO2020212661A1] The invention relates to a method for manufacturing a biometric sensor module (4) for a smart card, comprising steps, during which a dielectric support (101) is provided, comprising a front face and a rear face, both forming main faces of the support (101). A biometric sensor (300) is attached at the rear face for the detection of fingerprints, a detection area covered by the sensor on the rear face being placed facing a detection zone on the front face. Electrically conductive connection pads (7) are made on the rear face of the support (101) and are electrically connected to the biometric sensor (300). At least one connection pad (7) comprises a zone that is wettable by a welding material, extending over an area of between 0.2 and 5 square millimeters.
