Abstract (en)
[origin: CN114074861A] The invention relates to a textile machine having a plurality of identical stations, each of which is equipped with a signaling device by means of which the operating requirements of the stations can be displayed. In order to optimize the operation of a textile machine having a plurality of identical stations in such a way that the operator immediately informs one of the stations of failure in advance regardless of which area of the textile machine the operator currently stays in, the invention provides that the signal devices are arranged on the stations and can be controlled in such a way that the signal devices can be controlled by the operator. A plurality of running light rows are formed as needed, and each running light row extends from a station arranged at the machine end of the textile machine to a station needing to be operated.
