Abstract (en)

[origin: WO202221766A1] The invention relates to a method for operating a device for producing a product, comprising the following steps: - capturing at least one quality data record (10, 10') comprising measured values of one or more quality parameters, each corresponding to one property of the product; - capturing at least one associated machine data record (20, 20') comprising actual values of a plurality of adjustable machine parameters of the device; - chronologically assigning the quality data record (10, 10') to the machine data record (20, 20') and generating a first data record (30) comprising chronologically correlated measured values and actual values; - repeating the preceding steps at least once to generate at least one second data record (30'); - determining a correlation (40) between the quality parameter(s) and the machine parameters by comparing the captured data records (30, 30') and creating a control model for the device, - providing a corresponding target value for at least one of the adjustable machine parameters on the basis of the control model, proceeding from a target value of the quality parameter(s). The invention also relates to a computer program product for carrying out the method and to a device comprising said computer program product.
