Abstract (en)  
[origin: WO2020226600A2] The invention relates to a composition used in coating the inorganic compounds used in the production of laminate flooring containing melamine-formaldehyde resin in a ratio of 40-70%, cellulose in a ratio of 10-45%, epoxy resin in a ratio of 3-10%, caprolactam in a ratio of 1-5% and diethylene glycol substance in a ratio of 2-7% that enables to reduce the deformations on the surfaces of the press plates caused by inorganic compounds such as the aluminum oxide, etc. applied to the internal portions of said layer during the pressing process of the laminate flooring so as to provide the OVERLAY layer as one of the basic layers of laminate flooring to gain resistance against abrasion, scratching and heat.
