Abstract (en)
[origin: WO2020224981A1] The invention relates to a neutralization body (20), comprising an active-mass body (1), in which a pyrotechnic charge (2) is introduced. The active-mass body (1) comprises a channel (3). The channel is operatively connected to the pyrotechnic charge (2). The active-mass container (1) is provided with a closing cap (7). The closing cap (7) has an opening (12) and, at least on the inside, a nozzle shape. By means of said nozzle shape, an internal pressure can be built up within the closing cap (7). Said internal pressure contributes to the discharge of a pyroflame from the neutralization body (20) under pressure. An internal pressure produced in the nozzle therefore makes it possible that the pyroflame shoots out of the closing cap (7).
