Abstract (en)

[origin: WO202229292A1] When multiple sensors are installed in a control cabinet or on a production system, complex wiring is required to connect the sensors to a user device. This is disadvantageous. This disadvantage is eliminated by a sensor hub (20), comprising: at least one sensor communication device (21, 22, 23, 24), which is designed to receive sensor signals (27, 27', 27'', 27''') from at least two sensors (11, 12, 13, 14) and/or to send same to at least two sensors (11, 12, 13, 14); a computer device (25) which is communicatively connected to the at least one sensor communication device (21, 22, 23, 24) and which is designed for generating sensor data (28, 7, 8) using the sensor signals (27, 27', 27'', 27'''); and a transmitting device (26) which is designed to transmit the sensor data (28, 7, 8) via a single communications medium (4) to a user device (5), wherein the sensor data (28, 7, 8) specifies addresses (A1, A2, A3, A4) which are each assigned to one of the at least two sensors (11, 12, 13, 14).
