Abstract (en)  
The invention belongs to the field of constructional details in forestry winches or other machines, which require a space for storing tools. The present invention relates to an improved holder (12) for tools, preferably a chainsaw (3), and a working machine, in particular a winch, with the said holder. The holder comprises:- a first plate (12a), which is arranged to be mounted on the working machine in a fixed manner,- a second plate (12b), which is in its central part (12b") convex and arranged to be in contact with the first plate (12a),- a third plate (12c) and a fourth plate (12d), which is mounted on the second plate (12b) so that a space is created between the third and fourth plate, said space being arranged to receive a leaf of the chainsaw or a part of any other tool,- a fulcrum (12e) connecting the first plate (12a) and the convex part (12b") of the second plate so that the second plate (12b) and all other plates (12c, 12d) attached to it can rotate around the fulcrum, and- a suitable locking mechanism (12f) for locking rotation of the holder.Rotation around the fulcrum allows that the holder has a transport position and a position for pulling out the tool, wherein the angle between both positions is between 45° and 115°, optimally around 90°.
