Abstract (en)
[origin: CN114147822A] The invention relates to a receiving device (1) for a sideband coil, comprising a hub body (4), which is mounted so as to be rotatable about an axis of rotation (X), and a disk element (2), which extends in a plane extending perpendicular to the axis of rotation (X). According to the invention, the hub body (4) has at least two support jaws (6a to 6c) which are designed to at least indirectly internally clamp a sideband coil that can be at least partially fitted onto the hub body. The locking mechanism (11) has an adjusting element (12), which can be rotated in a defined manner about an axis of rotation (X) relative to the hub body (4), and at least one arm (13a to 13c), which couples the adjusting element (12) to one of the support jaws (6a to 6c). The rotational movement of the adjusting element (12) is converted into a linear displacement of the support jaws (6a to 6c) coupled to the arms (13a to 13c) radially with respect to the axis of rotation (X).
