Abstract (en)  
[origin: EP3971126A1] The present invention relates to a crane (1) comprising a base body (2) configured to rest upon a bearing surface (S), a boom (3) designed to move between a working state and a parking state, extending away from the body (2) between a lower portion (31) and an opposite upper portion (32), the boom (3) is hinged to the body (2) in a hinging zone (4) at the lower portion (31) and is able to move relative to the body (2) in a horizontal and/or vertical direction in the working state, a cable (5) connected to the body (2) and to the boom (3) at the upper portion (32). The crane is characterized in that it comprises a counter-frame (6) associated with the boom (3), which extends between a lower end (61) and an opposite upper end (62), the upper end (62) of the counter-frame (6) is hinged to the boom (3), the counter-frame (6) is configured to move between a first configuration in which the lower end (61) is connected to the lower portion (31) of the boom (3) when the boom (3) is in the working state and a second configuration in which the lower end (61) of the counter-frame (6) is released from the boom (3) and is connected to the body (2) when the boom (3) is in the parking state.
