Abstract (en)

[origin: EP3971377A1] Hinge (1) comprising two hinge elements (2, 3), each of which provided with a main extension along an extension axis (T, T'). In addition, each hinge element (2, 3) is embedded in a containment space (120, 130) respectively of a panel (12) and of a frame (13) and is perimetrically delimited by a peripheral edge (21, 31). In particular, the hinge (1) comprises at least one eccentric adjustment body (71, 72), which is mechanically connected to at least one of the hinge elements (2, 3) and is susceptible of being moved between at least one retracted position and at least one extended position, and in such positions the eccentric adjustment body (71, 72) projects from the corresponding peripheral edge (21, 31) to a different extent in order to adjust the position of the hinge elements (2, 3) with respect to the respective containment spaces (120, 130).
