Abstract (en)

[origin: WO2020239834A2] The invention relates to a closure device (1) for a container (2) having a container opening (10), wherein the closure device (1) has a lid element (3) for closing the container opening (10), a chamber (4) assigned to the lid element (3) and an inner housing (5), wherein the chamber (4) and the inner housing (5) have closing means (V) and opening means that correspond to one another. The chamber (4) locks with the inner housing (5), the lock (6) with the inner housing (5) being offset radially inwards in respect of a vertical (x) of the closure device (1) over a greatest width (k) of the chamber (4) in the offset direction (L). According to the invention, in order to specify a closure device which allows emptying of the chamber as the lid element is removed in an easy-to-handle fashion, with further preferred favourable manufacturability of the closure device, the lock (6) in the vertical direction (M) is designed separately from a shoulder section (40) of the inner housing (5) formed on the base side under the lock (6).
