Abstract (en)  
[origin: WO2020245308A1] The invention relates to a see-through security element (2), a security document (1), and a method for producing a see-through security element (2). The see-through security element has a first element with one or more transparent first sub-regions and at least one reflective second sub-region. The see-through security element has a second element with one or more first sub-regions, each of which forms a color filter during transmission, said color filter being calibrated for a respective assigned color, and at least one second sub-region, which is designed to be colorless, in particular colorlessly transparent, or which forms a color filter during transmission and/or reflection, said color filter being calibrated for a color that is not assigned to any of the one or more first sub-regions of the second element. The first sub-regions of the first element and the first sub-regions of the second element at least partly overlap.
