Abstract (en)

[origin: WO2020244757A1] The invention relates to a method for starting operation of an internal combustion engine (1), wherein the method comprises the steps of: when the internal combustion engine (1) is not operating, providing pressurized gas in the air intake duct (3); opening the intake valve (25) in a first cylinder (2a) while keeping the exhaust valve (24) of the first cylinder (2a) closed so as to allow the pressurized gas to enter the first cylinder (2a), press onto the corresponding piston (21) and thereby move the corresponding piston (21) and rotate the crank shaft (23); supplying fuel to at least one of the cylinders (2a, 2b) where the corresponding piston has performed or is performing a compression step so as to ignite the fuel and start operation of the engine (1). In the method the pressurized gas is provided by: closing the air intake duct (3) upstream the EGR conduit (5) and closing the exhaust duct (4) downstream the EGR conduit (5) so as to form a closed recirculation loop comprising the EGR conduit (5) for gas contained in the closed recirculation loop; and operating a controllable gas feeding device (9) arranged in the closed recirculation loop while keeping the intake valve(s) (25) closed, wherein the gas feeding device (9) is configured to feed gas from an inlet (9a) to an outlet (9b) thereof and wherein the gas feeding device (9) is operated so that a pressure of the gas contained in the closed recirculation loop is increased in the air intake duct (3) and decreased in the exhaust duct (4).
