Abstract (en)
[origin: WO2020244817A1] The invention relates to a method (100) for optically inspecting containers (2), wherein the containers (2) are transported (101) to an inspection unit (10) with an illumination unit (3) and with a camera (4), wherein the illumination unit (3) emits (102) light from a flat light-emitting surface (30), wherein the light is transmitted or reflected (104) via the containers (2), wherein the camera (4) captures (105) a respective at least one of the containers (2) and the light transmitted or reflected via same in at least one camera image (I), and wherein the at least one camera image (I) is analysed by an image processing unit (6) for intensity information in order to identify (107) foreign bodies (8) and/or defects (7) in the container, wherein the light emitted from the light-emitting surface (30) is locally encoded (103) on the basis of a wavelength characteristic and is captured by the camera (4) in such a way that different emission locations (31-42) on the light-emitting surface (3) can be differentiated (106) from one another in the at least one camera image (I), and that the image processing unit (6) analyses the at least one camera image (I) for location information of the emission locations (31-42), in order to differentiate (108) the defects (7) from the foreign bodies (8).
