Abstract (en)

[origin: EP3981927A1] The invention concerns a hydraulic valve for dual-flush toilet flush which allows to provide a first, partial, water draining and a second, complete, water draining, and which comprises a casing (2) intended to be combined with a passage for draining water from the toilet flush, a tubular element (3) housed and movable in the casing, a gasket (8) integral with the tubular element for the closing and opening of the passage for draining water, and movement means (9) intended to be combined with activation means operated by a user, which are active on the tubular element for its displacement between a resting position corresponding to the aforesaid closing and a first water draining position or a second water draining position corresponding to the aforesaid opening.
