Abstract (en)

[origin: WO2020252156A1] A plate having a top surface, a bottom surface, and an indentation configured to detachably and securely receive and/or engage an implement having a lip or raised rim, such as a beverage cup, is disclosed. The indentation may comprise a threaded configuration, or a series of grooves, suitable for engaging an implement having a lip or rim, such as beverage cup. The indentation may be a raised indentation or a recessed indentation, and may be closed or open to the top of the plate. The plate may also include at least one or more slits therein, the slits being capable of receiving therein an eating implement, such as a spoon, fork or knife. Engaging a drinking implement having a lip and/or rim with the indentation at the bottom surface of the plate accommodates the secure attachment of the drinking implement to the plate, permitting the user to accommodate the plate and a beverage implement (cup) securely, and with one hand.
