Abstract (en)

[origin: WO2020249461A1] The invention relates to a method for identifying damage on a compressor having an intake side and a discharge side, comprising the following steps: (i) detecting measurement data of the intake pressure ( $p_1$ ) and intake temperature ( $T_1$ ) measurement variables on the intake side, as well as end pressure ( $p_2$ ) and end temperature ( $T_2$ ) on the discharge side; (ii) determining a calculated end temperature ( $T_{2b}$ ), a calculated intake temperature ( $T_{1b}$ ), a calculated end pressure ( $p_{2b}$ ) or a calculated intake pressure ( $p_{1b}$ ) as a target variable, representing a good operating state of the compressor, as a function of the measurement data of max. three of the measurement variables ( $p_1, T_1, p_2, T_2$ ); (iii) determining a comparison variable from at least one of the measurement variables ( $p_1, T_1, p_2, T_2$ ) not used in step (ii); (iv) comparing the comparison variable and the target variable as a gauge of damage to the compressor; wherein the target variable determined in step (ii) is determined according to a model of the isentropic compression, taking into consideration the isentropic exponent ( $\kappa$ ) of the gas to be compressed and a correction factor ( $\eta$ ), and the correction factor ( $\eta$ ) is adjusted on the basis of measurement data.
