Abstract (en)

[origin: EP3985212A1] The present invention relates to an inner knob (1) for an electronic locking cylinder (42) and a locking cylinder with such an inner knob. The inner knob (1) comprises a freewheel mechanism, wherein rotation of the knob in the freewheeling direction does not couple to a locking bit (3) of the locking cylinder (42) and rotation of the knob (1) in the opposite direction results in a coupling with the locking bit. Thus, it is achieved that a door with such a locking cylinder cannot be locked from inside but always unlocked from inside.
