Abstract (en)
[origin: WO2022028727A1] The invention relates to an integrated device for opening and closing cans and boxes with deformation-resistant can oval sections (1) in order to allow a partial emptying of the contents with a subsequent closure of a container (2), comprising a detachable oval section (3) as an essential component of the container lid (4) of the container, said oval section being delimited by a circumferential grooved line (5), and comprising a lever (6) for opening the oval section, which is rigidly connected to the container lid by a central rivet (7) or similar known techniques. The invention is characterized in that the lever (6) comprises one rivet side (13) provided with an elongation of the lever for tearing off (8), said elongation having a fold (9) towards the container lid (4), whereas the other side has a handle (10) with an upper cover of the oval section (11) and the oval section (3), which has two connections to the container lid (4) of the container (2) and contains a non-deformable surface.
