Abstract (en)

A heater (25) includes a liquid supply channel (58) which is formed in a main body and configured to transport a liquid, and atomizer (56) which is disposed near an outlet of the liquid supply channel in the main body and atomizes the liquid when the liquid is supplied. The heater is configured to be usable in a non-combustion-type suction device having a suction port. In the heater, a liquid exposure area (61), in which the liquid is exposed to a surface of the main body, is formed between the liquid supply channel and the atomizer.
