Abstract (en)
[origin: WO2020259781A1] Disclosed is an ultrasonic flow meter and a method of determining a flow rate of a fluid in a flow path between a transmitter Tx and a receiver Rx. There is an act of transmitting multiple wave packets through the flow path, each wave packet generated from a set of different Tx-parameter types. At least two wave packets have different Tx-parameter values. There is an act of receiving the multiple wave packets. Also disclosed are means for performing the acts as well as computer programs with instructions to perform the acts.
