Abstract (en)
[origin: WO2020259764A1] The invention relates to a training manikin for simulating cardiopulmonary resuscitation, comprising a foam body which supports the schematic structure of a human torso with or without a head and consists of a single foam, wherein a signal-generating unit is arranged inside the foam body and is situated in the foam body in a region underneath the sternum of the torso with or without a head and emits a signal within a time interval of 100 ms to 1000 ms when the sternum region of the torso with or without a head is compressed to a compression depth of 3 to 8 cm during a compression period. The invention also relates to the use of such a training manikin as a training device for cardiopulmonary resuscitation exercises.
