Abstract (en)
[origin: EP3993445A1] The present application discloses a hearing assistance device, and the hearing assistance may comprise: a signal input module configured to receive an initial sound and convert the initial sound into an electrical signal; a signal processing module configured to process the electrical signal and generate a control signal; and at least one output transducer configured to convert the control signal into a bone conduction sound wave of an user and an air conduction sound wave that can be heard by the user's ears, wherein within a target frequency range, the air conduction sound wave is transmitted to the user's ears, so that a sound intensity of an air conduction sound heard by the user's ears is stronger than a sound intensity of the initial sound received by the signal input module.
