Abstract (en)
A lighting system (10), in particular for marking carriageways and/or tunnel walls but not only, comprises an electrical feeder (30, 20), a plurality of inductive lighting devices (100) having a local coupler (110; 111, 112) adapted to be coupled to the electrical feeder (30, 20), a transceiver (120) and a light source or sensor (140), a control unit (60) which is connected to the electrical feeder (30, 20) and is configured to transmit control signals (61, 115) via the electrical feeder (30, 20) to the transceiver (120) of each inductive lighting device (100) via the local coupler (110; 111, 112) of the respective inductive lighting device (100), wherein the transceiver (120) is configured to transmit control signals (61, 115) to the control unit (60). The electrical feeder (30, 20) comprises an AC power source at a first frequency, in that the control unit (60) is connected to a modem (65) modulating and demodulating said control signals at a second frequency being different to the first frequency, in that a matching network (50) and a termination network (40) are provided at the beginning and at the end of the electrical feeder line (20) with a predetermined impedance, and in that each inductive lighting device (100) comprises a variable AC resonant circuit and or variable voltage limitation (131, 132) and or a variable voltage limitation circuit adjusting AC line currents of varying levels to a continuous level.
