Abstract (en)

[origin: WO2021002754A1] A pour spout (1) has an elongate conduit portion (3) obliquely projecting from a coupling cap portion (4), which is arranged for coupling to a container (2). At least one sealing surface (6, 7, 8) of the coupling cap portion is arranged for sealing engagement around the opening of the container. A venting channel (18) interrupts the at least one sealing surface (6, 7, 8) for allowing venting of the container (2) through a passage between the coupling cap portion (4) and a portion of the container facing the venting channel. The venting channel (18) is provided on one single lateral side of the coupling cap portion (4) only. The lateral side where the venting channel (18) is provided is in a radial direction in which an angle between the longitudinal direction of the conduit portion (3) and the plane (19) is smallest.
