Abstract (en)

[origin: WO2021013534A1] The present application relates to a method and a test kit for carrying out a reaction for bisulphite modification of DNA in order to determine the patterns of methylation of the DNA, characterised in that, after a deamination reaction using bisulphite (e.g. sodium bisulphite or ammonium bisulphite) has taken place, the modified DNA is bound to a rough solid phase and all additional necessary method steps are carried out on this rough solid phase. Finally, the modified high-purity DNA is separated from this solid phase. The method can be carried out manually or automatically. The rough solid phase is a non-mineral material with a rough surface.
