Abstract (en)  
[origin: WO2021035432A1] A gas analyzer includes: a light source (110); an optical splitter (150), dividing light emitted by the light source into measurement light and reference light; a measurement arm (510) and a reference arm (530), wherein gas to be measured is filled in the measurement arm, reference gas is filled in the reference arm, the measurement light propagatively passes through the measurement arm, and the reference light propagatively passes through the reference arm; an optical detector (750), receiving light propagatively passing through the measurement arm and light propagatively passing through the reference arm, and converting the received light into electrical signals; and a coder (300), disposed between the optical splitter and the measurement arm and the reference arm, wherein the coder is configured to code one of the measurement light and the reference light and block the other one of the measurement light and the reference light. Therefore, the structure of the gas analyzer may be simplified.
