Abstract (en)

[origin: WO2021005286A1] Disclosed is a process for manufacturing a fibrous preform for a part made of composite material, comprising creating a fibrous texture (200) by three-dimensional or multilayer weaving between a plurality of weft layers (202) and of warp layers (201), with an extra-thick portion (203) comprising a sacrificial portion (210) and useful portion (211) that are adjacent in the warp direction; placing the fibrous texture (200) in a forming toolset; shaping the fibrous texture; and removing the sacrificial portion. During the weaving, one or more expansion elements are inserted into the weft layers situated at the core of the sacrificial portion (210). Each expansion element has a cross section greater than the cross section or titer of the weft threads or strands present in the useful portion (211).
