Abstract (en)  
The capsule for infusing a beverage comprises a structure in the form of a bowl (1) which includes a base (6), a lateral wall (9) and a mouth which is closed by a cover (3). A first objective of the invention is to reduce the amount of plastic material employed in the manufacture of the capsule; a second objective of the invention is to reduce the complexity of its manufacture; and a third objective of the invention is to achieve the opening of the capsule by means of the breaking of a laminar membrane (5) solely by means of an increase in the pressure of the liquid mixture within the capsule without physical contact of an additional element in order to break said laminar membrane (5) which separates a lower chamber from an upper chamber. All of the above enables an emulsion of the foodstuff (for example, coffee) with the formation of a long-lasting rich, abundant cream.
