Abstract (en)
[origin: WO2021008713A1] Apparatuses, methods, and systems are disclosed for measuring RTT. One apparatus (400) includes a processor (405) and a transceiver (425) that communicates (705) with a mobile core network via an interworking function. The processor transmits (710) a first request to establish a data connection between the apparatus and the mobile core network, wherein the first request includes a first indicator that the apparatus supports round trip time ("RTT") measurements, the RTT measurements calculated using messages transmitted via the data connection and using an encapsulation header. The processor receives (715) a first message from the interworking function and transmits (720) a second message to the interworking function, wherein the first message includes a first encapsulation header comprising an echo request indication wherein the second message includes a second encapsulation header comprising an echo response indication.
