Abstract (en)

[origin: MX2021013799A] An actuating handle for a window or a door is proposed, having a handle which is mounted with a handle neck so that it can rotate about an axis of rotation of a stop body and has an elongate driver for entering into an operative connection with an actuating element of the window or the door, which is non-rotatably connected to the Handle can be coupled, wherein the handle neck can be connected to a socket for fixing the handle to the stop body. According to the invention it is provided that the actuating handle has a depression; that the driver can be introduced into the recess in a longitudinally displaceable manner; that a compression spring is arranged in the recess and exerts a pressure force directed from the recess on the driver; and that the driver has at least one first stop element, which corresponds to at least one second stop element in or on the depression, so that a movement of the driver directed out of the depression is limited by the stop elements.
