Abstract (en)

[origin: WO2021019017A2] The invention relates to an oscillating machine drive in which a first crucible which is mounted to move against the restoring force of a spring is set by an eccentric into an oscillating motion such that the first crucible is moved back and forth between a first return position (first dead centre), in which the receiving surface of the crucible is spaced apart from a counter-surface of a second crucible, and a second return position (second dead centre), in which the receiving surface of the crucible is pressed onto the counter-surface of the second crucible, an adjustment eccentric being arranged on a main eccentric such that the angle can be adjusted.
