Abstract (en)

[origin: CA3204366A1] The invention relates to a mould for continuous casting, comprising a lubricant channel (2) opening into the running surface (1), which channel has a distribution portion (3) adjoining the running surface (1). According to the invention, in order to design a mould of the aforementioned type in such a way that a uniform lubrication of the running surface of a mould is possible using as few wear-susceptible components as possible, the flow resistance within the distribution portion (3) increases in the direction of the running surface (1) and, in a discharge region (4) of the distribution portion (3) adjoining the running surface, is constant parallel to the running surface (1).
