Abstract (en)

Safety device (10) for an actuator (100) for a window unit where the actuator (100) comprises a frame (11), an actuation member (12) and an operating device fixed to the frame (11) and coupled to the actuation member (12). In an opening configuration of the window unit the actuation member (12) is extended and in a closing configuration it is retracted. The safety device (10) comprises:- a base (13),- a locking element (14) movable between a rest configuration and an operating configuration;- elastic means (15) for forcing the locking element (14) into the operating configuration;- a yielding block (16) for retaining the locking element (14). The yielding block (16), when a predefined temperature is reached, yields so as to allow the locking element (14) to reach the operating configuration and interfere with the actuation member (12) so as to oppose the retraction thereof with respect to the frame 11 and allow the extension thereof.
