Abstract (en)

A device (20) for determining position information includes a detector (22) that is configured to detect a position of the device and a processor (24) that is configured to determine the position information based on a primary position indication from the detector and a secondary position indication from a second detector (30, 32) that is distinct from the detector. The processor determines the position information by aligning the primary position indication with the secondary position indication based on identifying a pattern of the primary position indication that corresponds with a pattern of the secondary position indication.
