Abstract (en)

[origin: WO2021046005A1] In a particular implementation, a method of aggregating data for unmanned aerial vehicle (UAV) navigation is disclosed. Data corresponding to geographic locations is received at a server from a plurality of data servers. A data type is determined for each of the data received from the plurality of data servers. A plurality of aggregate data layers each corresponding to one data type is generated from the received data. A telemetry data layer is generated, in dependence upon telemetry data received from at least one UAV, from the telemetry data. A map is generated, wherein the map is overlaid with the telemetry data layer and the plurality aggregate data layers.
