Abstract (en)

[origin: WO2021032437A1] The invention relates to a device (10) for mounting a multi-apparatus housing, which comprises a cover element (300) pivotally mounted on a fixed support (100), automatic opening means comprising, on the one hand, a main elastic element (500) which acts on the cover element (300) to cause a tilting movement from a closed position to an open position, and, on the other hand, damping means (400, 110) which act between the cover member and the fixed support during the tilting movement to control and dampen the stroke of the cover member. According to the invention, the device comprises a part for mounting (200) the housing, which part is pivotally mounted on the fixed support, and drive means (321, 221) which cooperate such that, during only part of the tilting movement of the cover element, the latter causes the mounting part to tilt between closed and open positions.
