Abstract (en)
[origin: WO2021040574A1] The present invention relates to a method for coding a video sequence using partitioning and prediction of a current block with a non-horizontal and non-vertical boundary between prediction partitions, the method being implemented by a decoding device or an encoding device, wherein only a subsampled residual block corresponding to a boundary region of non-zero residuals covering the boundary between the prediction partitions is transformed and coded in the bitstream of the video.
