Abstract (en)

[origin: EP4026646A1] A stir pin includes: a base end portion holdable by a pin holder; a stirring portion rotatable about a first axis relative to a shoulder member; and an intermediate portion provided between the base end portion and the stirring portion and rotatable about the first axis together with the stirring portion. The intermediate portion includes a first portion and a second portion that is provided further in a first direction than the first portion. The first direction is defined as a direction from the base end portion toward the stirring portion. The first portion includes a protrusion protruding beyond an outer surface of the second portion in a direction away from the first axis. The protrusion has a surface that is pointed in the first direction and defines a ring-shaped receiving surface that receives a material waste generated as a result of a friction stirring.
