Abstract (en)  
[origin: WO2021051102A1] Embodiments of a wood-type club head having a flex structure to control the characteristic time (CT) are described herein. The club head comprises a flex structure integrally formed with the club face and the sole. The flex structure comprises a curved shape including a nadir and an apex. The flex structure allows the club face to bend rearward, relieve stress within the club face, and reduce the CT variability within a localized club face region.
