Abstract (en)
[origin: CN216932458U] According to the utility model, the adjusting device for the headrest is provided with at least one first headrest keeping piece and at least one second headrest keeping piece, wherein the first headrest keeping piece is used for keeping the headrest; at least one fixed first mounting plate on which the first headrest holder is held so as to be pivotable about a first axis of rotation; a drive unit having a drive element which can be linearly adjusted along a fixed spatial axis between an initial position and an end position; and a coupling element hinged at one end to the drive element and at the other end to the first headrest holder, where linear movement of the drive element causes the first headrest holder to rotate about the first rotational axis. Furthermore, a stop element is in contact with the coupling element or the first headrest holder in the intermediate position of the drive element, and the stop element blocks further rotation of the coupling element relative to the first headrest holder between the intermediate position and the end position.
