Abstract (en)
A terminal according to an aspect of the present disclosure includes: a transmitting section that transmits a plurality of pieces of channel state information (CSI) in different occasions, the plurality of pieces of CSI corresponding to at least one channel measurement; and a control section that determines, in response to reception of information corresponding to at least one piece of CSI of the plurality of pieces of CSI, whether or not to perform retransmission of the at least one piece of CSI. With this configuration, reduction of reliability of CSI can be prevented while reducing increase of UL overhead.
