Abstract (en)
[origin: WO2021043351A2] The invention relates to a holding device, in particular a luggage carrier for bicycles for transporting bags or containers, comprising at least two vertical lateral braces on each side, said braces being connected to a lower dropout of the luggage carrier and being formed with a reinforcing horizontal connection element between the front and rear lateral brace, when viewed in the travel direction, in the region of the upper end of the braces and with a securing device between the front lateral brace and the frame of the bicycle or the saddle support or the saddle tube. Each of the dropouts is formed with a securing fork which can be attached so as to engage into pivot bolts that are adapted or mounted on the bicycle by means of a screw connection and comprise rotary bearings, and a locking hook which runs parallel to the fork and is rotatably mounted is designed to pivot over the open region of the fork and reversibly secure the dropout, and thus the luggage carrier, to the pivot bolt in the form of a quick-release fastener, wherein receiving elements for bags or containers can be reversibly attached to the horizontal connection element which connects the two vertically connected lateral braces, or securing points are arranged on the connection element in order to receive a bag or a container or can be attached thereto and/or at least one securing point is arranged on at least one of the vertical lateral braces so as to correspond to a receiving point on a bag or a container.
