Abstract (en)

A scraping device mountable to a vehicle and comprising a central base part and two lateral wings arranged on opposite sides of the base part and mounted to a respective support frame that is hinged to the base part, wherein each lateral wing (10a) is, by a main hydraulic cylinder (30a), pivotable in relation to the base part about a pivot axis together with the associated support frame (20a) between a swung-in non-operative position and a swung-out operative position. Each lateral wing is slidable upwards and downwards in relation to the associated support frame between a lowermost position and an uppermost position in directions parallel to the pivot axis. Each lateral wing is, by a lifting mechanism and an auxiliary hydraulic cylinder that are mounted to the support frame of the lateral wing, liftable upwards in relation to the support frame from its lowermost position to a raised resting position.
