Abstract (en)

[origin: WO2021058477A1] The present invention relates to an implantable banding device (600) comprising an elongated hollow textile element (500) which comprises an attachment portion (540) and an adjustable loop (510) the perimeter of which is adjustable by sliding a portion of the adjustable loop (510) into an interior space of a sleeve (530) arranged in the textile element (500), and a member for closing the banding (100) which comprises a front portion to which the adjustable loop (510) or the attachment portion (540) is connected, and a rear portion comprising a first U-shaped recess (170, 180) configured to receive part of the attachment portion (540) or part of the adjustable loop (510). The banding device (600) thus comprises a position in which the banding is tightened by sliding the adjustable loop (510) into the sleeve (530) and a locking position in which sliding of the adjustable loop (510) is prevented by the sleeve (530). The present invention also relates to an osteosynthesis device comprising the banding device (600).
