Abstract (en)

[origin: WO2021058781A1] The invention relates to a structure (1) comprising: a framework (2) formed by perpendicular supports (6), each mounted in a foundation in the ground; beams attached to the supports (6) and extending horizontally between the supports (6); usable units (4) directly resting on just two respective beams and each being formed by at least one shipping container; and walkable access routes (5) attached to the framework (2) and supply and waste disposal lines from the ground to each of the usable units (4). The invention also relates to a method for erecting a structure (1) of this type. In order to increase the variability of the structure (1), it is proposed that the supports (6) have a longitudinal grid spacing of 0.4 to 0.6 times a length of the usable units (4) in a longitudinal direction (11) of the usable units (4).
