Abstract (en)

[origin: WO2021058618A1] The invention relates to a device for handling value documents (28, 48, 50), which has an output compartment (72) for the withdrawal of value documents (48). The output compartment (72) is delimited by a receiving element (62) on a first side, by a limiting element (74) on a second side, and by a closure element (60) on a third side in a closed position. The limiting element (74) is arranged in a first limiting position in order to supply the value documents (48) into the output compartment (72). With a movement of the receiving element (62) in the direction of the limiting element (74), the limiting element (74) is moved from the first limiting position into a second limiting position. In order to open the output compartment (72), the closure element is moved from the closed position into the open position, wherein an engaging element (102, 103) of the limiting element (74) engages with an engaging region of the closure element (60) when moving the closure element (60), or in the open position of the closure element (60), if the limiting element (74) is in the second limiting position.
