Abstract (en)
[origin: WO2021058517A1] A fuse-comprising circuit-breaking apparatus, comprising: - a casing comprising at least one housing for receiving a fuse; and - at least one electrical connector (10) that is associated with said housing with a view to connecting an end terminal of a fuse when this fuse is inserted into the receiving housing; characterised in that the electrical connector (10) comprises a base segment (22) and a plurality of first contact fingers (24) and of second contact fingers (24') that are arranged in succession along the base segment, in alternation on either side of a median geometric plane of the base segment (22), so as to define a longitudinal receiving region for accommodating the terminal.
