Abstract (en)

This pure copper plate or sheet contains 99.96% by mass or greater of Cu, in which when an average crystal grain size of crystal grains in a rolled surface is represented by X μm and an amount of Ag is represented by Y mass ppm, an expression of $1 \times 10^{<\sup>-8} \leq X^{<\sup>-3} / Y^{<\sup>-1} \leq 1 \times 10^{<\sup>-5}$ is satisfied, and when a ratio of J3, in which all three grain boundaries constituting a grain boundary triple junction are special grain boundaries, to all grain boundary triple junctions is defined as $NF<\sub>J3</sub>$ and a ratio of J2, in which two grain boundaries constituting a grain boundary triple junction are special grain boundaries and one grain boundary constituting the grain boundary triple junction is a random grain boundary, to all grain boundary triple junctions is defined as $NF<\sub>J2</sub>$, an expression of $0.30 < (NF<\sub>J2</sub> / (1 - NF<\sub>J3</sub>))^{<\sup>0.5} \leq 0.48$ is satisfied.
